

Now that your system has been pumped, here are some tips:

Our technician will be happy to answer any questions you may have about your septic system.

1. **We recommend that the system be refilled with fresh water once we leave.** This can take most of the day. We are unable to refill your tanks due to time constraints. This will help prevent floatation or implosion of tanks. Anytime a tank is pumped out it is under stress that it normally does not have at normal operating level.

- After an [Aerobic System](#) is pumped you may get an air alarm. This is normal. The alarm should reset once your system is full again.
- [Conventional Systems](#) are hard to tell when they are at operating level, but you will need to turn on the water for at least an hour or two.

2. All septic systems are designed for human waste. Refrain from putting trash such as: food waste, baby wipes, feminine products or any other items that do not biodegrade in your sinks or toilets. More information can be found at www.texasseptic.com.

3. All systems are recommended to be pumped out on a routine schedule. Typically:

- [Conventional System](#) - every five to seven years
- [Aerobic System](#) - every three to five years.

This can vary depending on how the system is used, how many people live in the house and if the tanks leak. The longer you wait the more potential issues you may have.

Call us for all your future septic needs:

We also have enzymes for your [Conventional Septic](#) system or chlorine for your [Aerobic Septic](#) system.
